

Coastal protection made of Elastocoast® in Sebangan Bajong, Sarawak (Malaysia)

Case Study

Despite a conventional protection the coast of Sebangan Bajong was eroded more than 500 meters during the past ten years. Now Elastocoast® ensures the protection against erosion and proves to be a suitable solution both from an economic and an environmental perspective. It enables the growth of small plants between the porous granite and furthermore provides a better view along the coastline compared to the use of big boulder.

Task: Coastal protection

Bonding agent: Elastocoast® 6551/103; approx. 8.4 t

Year of construction: 2011

Realization: Tradimas

Competent authority: Department of Irrigation and Drainage

Planning: Mohammad

Area: 5,000 m²
